5 Preferably, the recess is configured such that when the cover is mounted to the housing, a sound outlet is formed in the joint between the cover and the housing in the region of the recess. The aperture is most preferably a narrow slit and is largely obscured by the joint between the cover and the housing to prevent a user from being tempted to place this side of the telephone against the ear.

1059 Please replace paragraph beginning at line 18 of page 7, with the following rewritten paragraph:

9³
15 The inside face of the rear wall 12 is integrally formed with a seat to receive a transducer 16 having an upper surface 16a, illustrated in Figure 3. The transducer 16 is capable of relatively high acoustic volume and is used when the "hands free" mode is selected. The seat has an annular portion 17 against which the transducer 16 rests when placed on the housing 11 as shown in Figure 2. The annular portion 17 has an aperture 18 which acts as a duct for the transmission of sound generated by the transducer 16 through the rear wall 12 of the housing 11. The periphery of the annular portion 17 has an integrally formed upstanding wall 19 extending around its circumference having a top edge 20. The diameter of the annular portion 17 is slightly greater than the diameter of the transducer 16 which locates
20 within the area enclosed by it on the annular portion 17.

Please replace paragraph beginning at line 17 at page 9, with the following rewritten paragraph:

 5 Another embodiment will now be explained with reference to Figures 5, 6 and 7. It will be appreciated that this embodiment may or may not be combined with the first embodiment described with reference to Figures 2 to 4. However, it is envisaged that both embodiments will be used together.

In the Drawings:

10 Enclosed is a Submission of Proposed Drawing Amendment for Approval by Examiner (37 C.F.R. 1.123). The reason for this proposed drawing change is to have the identification of the arrows shown therein to be in conformance with the specification.

In the Claims:

25
 3 11. (Amended) A device according to claim 10, wherein the spring comprises at least one region of the substantially planar annular ring which is deformed out of the plane of said ring, said region being deflected back toward the plane of said ring when in contact with
 4 the upper surface of a transducer and the retainer is rotated to attach it to the housing, the
 5 resilience of each of said at least one region biasing the transducer toward the housing.

26
 2 24. (Amended) An electronic device comprising a housing, a cover, a transducer and a retainer for mounting the transducer on the housing, the retainer including a first
